

Inspect Workout Student Instructions

Introduction

Welcome to the Inspect workout! In this workout, you will learn about the security issues involving hard-coding sensitive information. You will use the developer tools for your browser to interact with your HTML page and uncover the hard-coded information.

Scenario

The Trojan Cyber Arena is undergoing a complete renovation due to our *brilliant* success in storing classified information. Definitely *not* because we took out a MASSIVE loan for a Rick Astley shrine and matching furniture set. Anywho, I need your help unpacking some boxes. The other interns have the physical boxes covered; I have a special assignment for you on our web server. We have some digital boxes that arrived with our order. Somehow a special item of interest got stored in one of the boxes. It may or may not be a classified flag. Could you search the boxes and see what you can find?

Accessing the Workout

From your student landing page, click the *Enter Workout* button to access UA Little Rock: Classified's Inspect workout automatically.

The Mission

You will need to find the classified flag within the web page. Programmers and web developers are constantly leaving information about different blocks of code inside their web applications. Anyone with access to the code can view this information, which is also known as comments, and sometimes, developers can accidentally leave sensitive information out in the open. To find the flag hidden inside the web source code, you will need to use the inspect element tool.
